SECTION 11.1 MEASURING ANGLES

VOCABULARY

DEFINITION	EXAMPLE
<b>Ray:</b> Part of a straight line. It has a starting point and continues in only one direction.	
<b>Angle:</b> Formed when two rays share a common endpoint (vertex)	
<b>Vertex:</b> The point shared by two rays forming an angle.	
<b>Degree:</b> An equal part of a circle - there are 360 degrees in a circle, also written $360^\circ$	
<b>Perpendicular:</b> When 2 lines meet and form right ( $90^\circ$ ) angles.	
<b>Supplementary angle:</b> Two angles whose sum is $180^\circ$	
<b>Complementary angle:</b> Two angles whose sum is $90^\circ$	
<b>Acute angle:</b> An angle with a measure between $0^\circ$ and $90^\circ$	
<b>Obtuse angle:</b> An angle with a measure between $90^\circ$ and $180^\circ$	

**Big Idea:** How do I measure and classify types of angles?

Angles are measured as part of a circle. From its center, a circle can be divided into 360 equal parts. Each part is one **degree** written  $1^\circ$ . A full circle contains  $360^\circ$ . The instrument used to measure angles is called a **protractor**.

How do you measure an angle using a protractor?

Line up one ray with the protractor.  
 Make sure the vertex is at the center of the semicircle.  
 Read the measure at the mark that the other ray goes through.  
 Be careful about acute vs. obtuse angles.

How do you measure an angle whose rays are not on the baseline?

Subtract, as though on a ruler.

How do you name (identify) an angle?

1. A non-vertex point on one ray.
2. Vertex point.
3. A non-vertex point on the other ray.

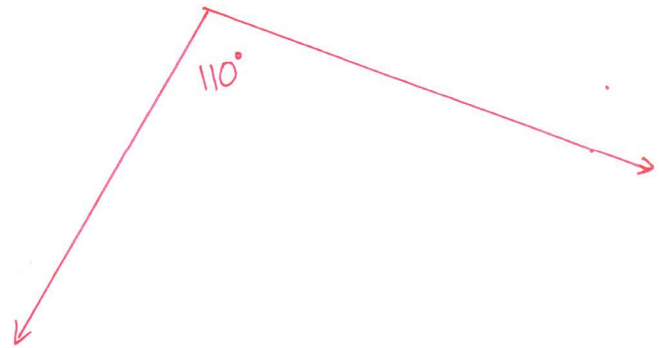

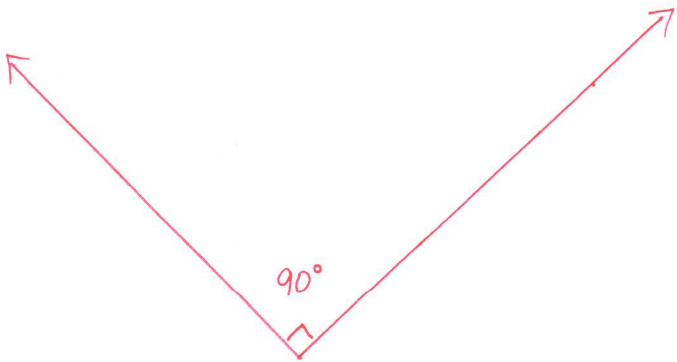

$\angle QRS$  or  $\angle SRQ$

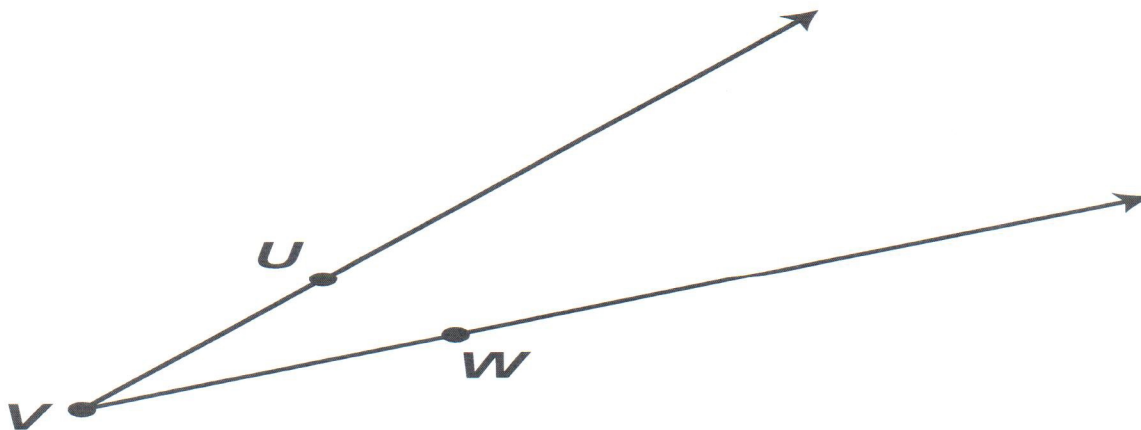

**PRACTICE EXERCISES**

1. Use a protractor to draw the angles below with following measures on a separate sheet of paper:

20°, 45°, 90°, 100°, 180°

2. Measure each of the angles to the nearest degree and determine their type.

Name:  $\angle JKL$  OR  $\angle LKJ$

Name:  $\angle UVW$  OR  $\angle WVU$

Angle measure:  $38^\circ$

Angle measure:  $17^\circ$

Type: acute

Type: acute

Name:  $\angle XYZ$  or  $\angle ZYX$

Name:  $\angle QPR$  or  $\angle RPQ$

Angle measure:  $90^\circ$

Angle measure:  $160^\circ$

Type: right

Type: obtuse

Name:  $\angle MNO$  or  $\angle ONM$

Angle measure:  $170^\circ$

Type: obtuse

3. Use the figure above and

- Name a pair of supplementary angle :  $\angle AEB$  and  $\angle BED$  or  $\angle AEC$  and  $\angle CED$
- Name a pair of complementary angle :  $\angle BEC$  and  $\angle CED$
- Name an obtuse angle :  $\angle AEC$
- Name an acute angle :  $\angle BEC$  or  $\angle CED$

4. Given the measure of  $\angle B = 20^\circ$ ,
- What is the measure of its complement?
  - What is the measure of its supplement?

$$m\angle B + \text{complement} = 90^\circ$$

$$20^\circ + \text{complement} = 90^\circ$$

$$\begin{array}{r} -20^\circ \\ \hline \end{array}$$

$$\text{measure of complement} = 70^\circ$$

$$m\angle B + \text{supplement} = 180^\circ$$

$$20^\circ + \text{supplement} = 180^\circ$$

$$20^\circ + \text{supplement} - 20^\circ = 180^\circ - 20^\circ$$

$$\text{measure of supplement} = 160^\circ$$

**SUMMARY (What I learned today)**
